

# Virgo SLM V1.0 Report Blueprint (v4)

Tagline: "Not Everybody Needs The Blueprint."

## Model Capability Assessment (Include this in the final report)

This section should honestly summarize Virgo's current strengths and weaknesses. The purpose is transparency, not marketing. Mention that the project is still under active development and that these observations reflect the current release.

| Capability               | Current Status      | Comments                                                                                    |
|--------------------------|---------------------|---------------------------------------------------------------------------------------------|
| Text Generation          | ■■■■■ Strong        | Produces coherent paragraphs, articles, and general text.                                   |
| Language Coherence       | ■■■■■ Strong        | Maintains good sentence flow and readability.                                               |
| Basic Conversation       | ■■■■■ Strong        | Handles everyday prompts and general chat well.                                             |
| Writing Tasks            | ■■■■■ Strong        | Performs well on rewriting, formatting, summaries, and simple writing.                      |
| Programming              | ■■■■■ Good          | Can generate and explain basic code, but makes mistakes on complex tasks.                   |
| Instruction Following    | ■■■■■ Improving     | Better than the base model after Phase III, but still inconsistent on complex instructions. |
| Reasoning                | ■■■■■ Weak          | Logical and multi-step reasoning remain active areas for improvement.                       |
| Mathematics              | ■■■■■ Limited       | Not reliable for advanced calculations or proofs.                                           |
| Long Context             | ■■■■■ Limited       | Context length and long conversations remain limited.                                       |
| Memory                   | ■■■■■ Not Supported | No persistent memory between conversations.                                                 |
| Web Search               | ■                   | Not supported.                                                                              |
| Image Generation         | ■                   | Not supported.                                                                              |
| File Creation / Tool Use | ■                   | Not supported in the model itself.                                                          |

## Suggested Note

State that Virgo is primarily a language generation model. Its strongest abilities are coherent text generation, writing assistance, and basic conversational responses. Reasoning, instruction following, mathematics, and advanced planning are acknowledged limitations that future versions aim to improve.

## Why include this table?

An honest capability table makes the report more credible. It shows that the goal of the project is learning and engineering rather than claiming benchmark leadership. Readers and recruiters generally appreciate transparent discussion of limitations alongside strengths.
